of 2-oxoglutarate

Ź 409

STANDARD;

```
SCIENCE 269:496-512(1995).

-!- FUNCTION: THE 2-OXOGLUTARATE DEHYDROGENASE COMPLEX CATALYZES THE OVERALL CONVERSION OF 2-OXOGLUTARATE TO SUCCINYL-COA & CO(2). IT CONTAINS MULTIPLE COPIES OF 3 ENZYMATIC COMPONENTS: 2-OXOGLUTARATE DEHYDROGENASE (E1), DIHYDROCLOPAMIDE SUCCINYLITRANSFERASE (E2) AND LIPOAMIDE DEHYDROGENASE (E3) (BY SIMILARITY).

-!- CATALYTIC ACTIVITY: SUCCINY1-COA + dihydrolipoamide = COA + S-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                "Whole-genome random sequencing and assembly of Haemophilus influenzae

The P protein binds the alpha-amino group of glycine through its pyridoxal phosphate cofactor; COC2 is released and through its pyridoxal phosphate sofactor; COC2 is released and the remaining methylamine moiety is then transferred to the lippanide ocfactor of the H protein.

similarity).
-!- PATHRAY: Tricarboxylic acid cycle.
-!- SUBUNIT: Forms a 24-polypeptide structural core with octahedral symmetry (By similarity).
-!- SIMILARITY: Belongs to the 2-oxoacid dehydrogenase family.
-!- SIMILARITY: Contains 1 lipoyl-binding domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Transferase; Acyltransferase; Lipoyl;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                LIPOYL (POTENTIAL).

  -i- FUNCTION: Serum albumin, the main protein of plasma, has a good binding capacity for water, Ca(2+), Na(+), K(+), fatty acids, hormones, bilirubin and drugs. Its main function is the regulation of the colloidal osmotic pressure of blood.
-i- SUBCELDULAR LOCATION: Secreted.
-i- TISSUE SPECIFICITY: Plasma.
-i- ALLERGEN: Causes an allergic reaction in human. Binds IgE. Partially heat-labile allergic with the bind-egg syndrome.
-i- SIMILARITY: Belongs to the ALB/AFP/VDB family.
-i- SIMILARITY: Contains 3 albumin domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

Expression detected in spleen, thymus, bone marrow and peripheral blood leukocytes but not in heart, brain, lung, liver, kidney or testis.

DEVELOPMENTAL STAGE: Expressed from early embryogenesis through to
"Molecular characterisation of mouse and human TSSC6: evidence that SSSC6 is a genuine member of the terraspanin superfamily and is expressed specifically in haematopoietic organs."; Biochim. Biophys. Acta 1522:31-41(2001).

Nuclectide sequence of porcine liver albumin.";

Nuclectide sequence of porcine liver albumin.";

Nucleic Acids Res. 16:9045-9045(1988).

Include the main protein of plasma, has a good binding capacity for water, Ca(2+), Na(+), K(+), fatty acids, binding capacity for water, Ca(2+), Na(+), K(+), fatty acids, hormones, bilitubin and drugs. Its main function is the regulation of the colloidal osmocile pressure of blood.

In SINCELNILAR LOCATION: Secreted.

In ISSUE SPECIFICITY: Plasma.

SINLIARITY: Belongs to the ALB/AFP/VDB family.

SIMLIARITY: Contains 3 albumin domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

Submitted (DEC-1994) to the BMEL/Genbank/DDBJ databases.
-!- FUNCTION: Serum albumin, the main protein of plasma, has a good
-!- FUNCTION: Serum albumin, the main protein of plasma, has a good
-!- FUNCTION: Serum albumin, the main protein of plasma, has a good
-!- Subming capacity for water, Ca(2+), Na(+), K(+), fatty acids,
--- SUBCELLUIAR LOCATION: Secreted.
-!- SUBCELLUIAR LOCATION: Secreted.
-!- SIMILARITY: Belongs to the ALB/AFP/VDB family.
-!- SIMILARITY: Contains 3 albumin domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PHMY MOUSE STANDARD, PRT; 256 AA.

J. Allergy Clin. Immunol. 93:614-627(1994)

Muchl S., Edwelger C., Sperr W.R., Pandpain and drugs. Its main function is the regulation of the colloidal osmotic pressure of blood.

J. Sumitar Location. Secreted.

J. TISSUE SPECIFICITY: Plasma.

J. AllERGEN: Gauses an allergic reaction in human.

J. AllERGEN: Contains 3 albumin domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This SWISS-PROT entry is copyright. "Structure of serum albumin: disulfide bridges.";

"Structure of serum albumin; disulfide bridges.";

Fed. Proc. 33:1389-1389(1974).

-! FUNCTION: Serum albumin, the main protein of plasma, has a good binding capacity for water, Ca(2+), Na(+), K(+), fatty acids, hormones, bilirubin and drugs. Its main function is the regulation of the colloidal osmotic pressure of blood.

-! SUBCELLUIAR LOCATION: Secreted.

-! TRSUB SPECTIFICITY: Plasma.

-! ALLERGEN: Causes an allergic reaction in human.

-! SIMILARITY: Belongs to the ALB/AFP/VDB family.

-! SIMILARITY: Contains 3 albumin domains.
                                                                SEQUENCE OF 1-32.

-I. FUNCTION: Serum albumin, the main protein of plasma, has a good binding capacity for water, Ca(2+), Na(+), K(+), fatty acids, hormones, bilirubin and drugs. Its main function is the regulation of the colloidal osmocic pressure of blood.
-I. SUBCELLULAR LOCATION: Secreted.
-I. TISSUE SPECIFICITY: Plasma.
-I. SIMILARITY: Belongs to the ALB/AFP/VDB family.

Comment: Serum albumin is synthesized in the liver as preproalbumin. It binds copper,
mones (weak bonds with these hormones promote their transfer across the membranes), thy

Serum albumin precursor - rat

Nalitarate names preproalbumin
C:Species: Ratus norvegicus (Norway rat)
C:Accession: Asyaria Asyaria Asyaria (Norway rat)
Proc. Mail. Acad. Soil U. S. N. 78, 243-246, 1981
A;Title: Nucleotide sequence of cloned rat serum albumin messenger RNA.
A;Reference number: A93872; MUD:81223722; PMID:7017712
A;Nolecule type: mRNA
A;Reference number: A93872
A;Nolecule type: Renate, C. D: Donohue, A.M.; Rodkey, U.A.; Alberts, A.W.
U. Biol. Chem. 222, 6846-6855, 1977
A;Nolecule type: Procein
A;No

A/Reprimental source: dental enamel proteins are also found in bone
C/Comment: Serum albumin synthesized in the liver as preproalbumin. It binds copper, tercid hormones (weak bonds with these hormones promote their transfer across the membra C/Superfamily: serum albumin, serum albumin repeat homology
C/Reywords: carrier protein; duplication; metal binding; plasma

Sequence 5, Application US/10153064
Patent No. 666485
GENERAL INFORMATION:
APPLICANT: Bell et al.
TITLE OF INVERTION: Chemokine Beta-1 Fusion Proteins
FILE REFERENCE: PFS56
                               LENGTH: 585 amino acids
TYPE: amino acid
TYPE: amino acid
TOPOLOGY: linear
MOLECULE TYPE: protein

TITLE OF INVENTION: OXYGEN-TRANSFORTING ALBUMIN-BASED BLOOD REPLACEMENT

TITLE OF INVENTION: OXYGEN-TRANSFORTING ALBUMIN-BASED BLOOD WORLD ALBUMIN-BASED BLOOD WO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   US-US-1/4-2

Sequence 2, Application US/08702572

Patent No. 2865386

GENERAL INPORMATION:
APPLICANT: Rarry-Williams, Sean M
APPLICANT: Gilbert, Sarah C
TITLE OF INVENTION: Yeast Strains and Modified Albumins
NUMBER OF SEQUENCES:
CORRESPONDENCE ADDRESS:
ADDRESSEE: Centeon L.L.C.
STREET: 1020 First Avenue
CITY: King of Prussia
COUNTRY: Ring of Prussia
COUNTRY: Pennsylvania
COUNTRY: RADABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC Compatible
OFFERATION SYSTEM: MS-DOS
SOFTWARE: MACIOSOFT WORD 6.0
CURRENT APPLICATION NUMBER: US/08/702,572
FILING DATE: 11-NOV-1996
CLASSIFICATION NUMBER: WO 95/23857
FILING DATE: IMAR-1995
APPLICATION NUMBER: MB 944270.2
FILING DATE: B-MR-1994
ATTORNEY/AGENT INFORMATION:
NAME: Naoni Biswas
NAME: Naoni Biswas

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Description

J. Biochem. 146:489-496(1985).

-!- FUNCTION: Serum albumin, the main protein of plasma, has a good binding capacity for water. (a(2+), Na(+), K(+), fatty acids, normans, bilirubin and drugs. Its main function is the regulation of the colloidal osmotic pressure of blood.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: Belongs to the ALB/AFP/VDB family.
-!- SIMILARITY: Contains 3 albumin domains.

-!- FUNCTION! Serum albumin, the main protein of plasma, has a good binding capacity for water, Ca(2+), Na(+), K(+), fatty acids, hormones, bilitubin and drugs. Its main function is the regulation of the colloidal osmotic pressure of blood.

-!- SUBCELLULAR LOCATION: Secreted.

-!- ALLERGEN! Causes an allergen that may cause both respiratory and food-allergy symptoms in patients with the bird-egg syndrome.

-!- SIMILARITY: Belongs to the ALB/ARP/VDB family.

-!- SIMILARITY: Contains 3 albumin domains.

RT dimensional gel electrophoresis a catalog of proteins detected by two-dimensional gel electrophoresis.";

Electrophoresis 13:970-931(1932).

CC -!- FUNCTION: Serum albumin, the main protein of plasma, has a good binding capacity for water, Ca(2+), Na(+), K(+), fatty acids, commonses, bilirubin and drugs. Its main function is the regulation of the colloidal osmotic pressure of blood.

CC -!- SUBCEDLULAR LOCATION: Secreted.

CC -!- SUBCEDLULAR LOCATION: Secreted.

CC -!- SIMILARITY: Belongs to the ALB/AFP/VDB family.

CC -!- SIMILARITY: Contains 3 albumin domains.

CC -!- SIMILARITY: Contains 3 albumin domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This SWISS-PROT entry is copyright. "Nucleotide and deduced amino acid sequence of sheep serum albumin.";

Nucleotide and deduced amino acid sequence of sheep serum albumin.";

Indian Serum albumin, the main protein of plasma, has a good binding capacity for water, Ca(2+), Na(+), K(+), fatty acids, hormones, bilitubin and drugs. Its main function is the regulation of the colloidal osmetic pressure of blood.
